```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 1

Sun Y; Helentjaris TG, Habben JE, WPI; 2000-687333/67. P-PSDB; AAB35801.

Nucleic acids useful for producing transgenic plants, preferably maize, with increased cell cycle gene activity, preferably activity of cyclin and/or cyclin-dependent kinase.

Claim 1; Page 104-106; 122pp; English.

Polymucleotide sequences AAC83101 - AAC83113 encode proteins AAB35794 - AAB35806 which are involved in regulating the cell cycle. The protein and DNA sequences have been isolated from Zea may8 (corn), and the invention also includes oligonucleotides AAC83114 - AAC83139 which are related to the cell cycle polymucleotides. The cell cycle polymucleotide sequences are useful for producing transgenic plants such as maize, soybean, sunflower, sorghum, canola, wheat, alfalfa, cotton, rice, barley and millet with increased levels of cell cycle gene activity, such as activity of cyclin and cyclin-dependent kinases. The DNA sequences are

\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$\$

```
New cell cycle protein and nucleic acid molecule encoding it useful for regulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAGGCTGGAACCCAGTAAGCTCACTGCCGTGCACAGGAAGTACAGTACCTACAAGTTCGGT

                                                                       à
                                                                                                                                       Š
   also useful as probes for detecting deficiencies in the level of mRNA in screening for desired transgenic plants, for detecting mutations in the gene, for monitoring upregulation of expression or changes in enzyme activity in screening assays of compounds, for detecting any number of allelic variants, orthologs or paralogs of the gene, and site-directed mutagenesis in eukaryotic cells. The DNA sequences are also useful for recombinant expression of the encoded polypeptides and as immunogens for preparing and screening antibodies. A transgenic plant comprising an expression cassette including a cell cycle regulatory gene is useful for assaying enzyme agonists and antagonists, and as immunogens or antigens to obtain antibodies. The antibodies are useful in assaying expression contains of levels of cell cycle regulatory proteins, for identifying and isolating nucleic acids from expression libraries, for identifying homologues of polypeptides from other species, and for purification of the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ATAGATAGATTCTTGGAAAAGGAAGTGGTTCCAAGGAAGAAGCTACAACTGGTTGGAGTC 828

The invention relates to a novel cell cycle protein (CCP) and the polymucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and anti-CCP antibody is useful for modulating the cell cycle protein the polypeptide and anti-CCP antibody is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana. Tice, wheat, maize, comato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat dioorders characterised by insufficient or excessive production of CCP protein forms which have decreased or portained activity. Compounds that bind to or modulate the activity of CCP protein forms which have decreased or polymucleotide is useful for modifying cell fate, plant development, plant morphology, blochemistry and/or physiology, the length of the G1, S, Gz and/or phase of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, shoot and root initiation and or development, nodule function, dwarfism in plants, contained in and/or development, nodule function, dwarfism in plants, contains a contained by a protein involved in the cell cycle due to environmental conditions, including abiotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or bacies stress such as cord activity of a protein involved in the cell cycle development and parts, including abiotic stress such as cold, nutrient deprivation, heat, drought, salt stress, or bacies stress such as manuscent cold pants, and parts, sold stress or better such as cold, nutrient deprivation, heat, drought, salt stress, or bacies stress such as immunogen to generate antibodies. CCP protein is useful to screen for naturally contained to modulate is useful to screen for protein of modulate cCP modulate e.g. enhance crop yields, and to modulate of m

New cell cycle protein and nucleic acid molecule encoding it useful fregulating cell cycle progression in plants and for identifying modulators which are useful as herbicides or plant growth regulators.

Claim 38; Fig 1; 316pp; English

The invention relates to a novel cell cycle protein (CCP) and the polynucleotides encoding them. CCP is useful for identifying a compound which modulates the activity of the polypeptide and which binds to the polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP

cc nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein forms which have decreased or production of CCP protein forms which have decreased or polypeptide are useful for polyment to or modulate the activity of CCP polypeptide are useful for modifying cell fate, plant development, polymential as herbicides or plant growth regulators. The collymucleotide is useful for modifying cell fate, plant development, by an analysis of the cell cycle of a plant, initiation, promotion, stimulation or enhancement of cell division, DNA replication, seed set, seed development, tuber, fruit, leaf formation, shoot and root initiation and/or development, tuber, fruit, leaf formation, shoot and root initiation and/or development, nodule function, dwarfism in plants, sensescence, tolerance or resistance to stress. CCP, the polymucleotide conditions, including abiotic stress such as cold, mutrient protein levels or activity of a protein involved in the cell cycle due to protein levels or activity of a protein inspects stress such as cold, mutrient conditions, including abiotic stress such as cold, mutrient conditions, including abiotic stress such as cold, mutrient conditions, including abiotic stress such as cold, mutrient conditions in storage cells, storage tissues and/or storage organs of plants or its parts. CCP is useful as an immunogen to storage organs of plants or its parts. CCP is useful as an immunogen condensation, to detect CCP mRNA, or a genetic lesion in a CCP gene and to protein, to detect CCP mRNA, or a genetic lesion in a CCP gene and to invention 8888888888888888888888888888888888

The invention relates to a novel cell cycle protein (CCP) and the polymucleotides encoding them. CCP is useful for identifying a compound polymucleotides the activity of the polymetide and which binds to the polymetide and which binds to the oplypeptide and anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell of cycle or growth of a plant such as Arabidopsis thalians, rice, wheat, compared and polymetide molecules are useful as modulating agents in nucleic acid and polymetide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat cisculating cell cycle progression in plants. CCP is useful to treat disorders characterised by insufficient or excessive production of CCP protein forms which have decreased or protein or production of CCP protein forms which have decreased or compensate are useful as nectivity of CCP polymetides are useful as herbicides or plant growth regulators. The polymucleotide is useful for modifying cell fate, plant development, plant morphology, biochemistry and/or physiclogy, the length of the G1, 1411 GIGCACAGGAAGIACAGIACCIACAAGIICGGIIGCGIGGCCAAGAIITIIGCCIGCGCAG 1335 TATCGGCCTTCGCCATCTGGCTGCTGCTGCTATATACTGCACAGTGTGCTATCAATCGT 1155 1232 rarictrickarkraageregeserkageaarerakkakrigereagigrakakrinaaga 1291 Cell cycle protein; CCP; ss; cell cycle regulation; herbicide; plant growth regulator; plant development; abictic stress; bictic stress; nutrient deprivation; pathogen attack; crop yield. stimulation or enhancement of cell division, DNA replication, seed set, seed development, tuber, fruit, leaf formation, seed set, seed development, tuber, fruit, leaf formation, seed set, initiation and/or development, nodule function, dwarfism in plants, senescence, tolerance or resistance to stress. CCP, the polymucleotide and the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein involved in the cell cycle due to environmental conditions, including abicic stress such as cold, mutrient deprivation, heat, drought, salt stress, or biotic stress such as pathogen attack, to modulate e.g. enhance crop yields, and attenuate plant architecture, plant quality traits, plant reproduction and seed development, endoreduplication in storage crop yields, and immunogen to generate antibodies. CCP protein is useful to screen for naturally contraining CCP protein, to detect CCP many, or a genetic lesion in a CCP gene and to modulate CCP activity. The present sequence encodes a CCP protein of the

This invention relates to the identification and isolation of movel nucleic acid molecules that confer altered visual phenotypes in plants. Specifically, it refers to modifications of plant architecture and/ or leaf surface features in plants, such as chlorotic, bleaching, etching, wer leaf, stunting, elongation and texture phenotypes, which are thought will be agronomic traits beneficial to the farmer. As such, these novel penorypes can affect growth regulation i.e. useful for creating dwarf varieties, exhibit resistance to insects or heat stress, confer changes in pigment content such that plants have enhanced vitamin production or calculated sensescence and also for example produce plants that control the production of ethylene. Furthermore, the present invention comprises generating transgenic plants, as well as reproducibly altering the visual phenotype of plant seeds, plant tissues and plant cells containing the phenotype of plants seeds, plant tissues and plant cells containing the conting cDNA sequence that confers an altered visual phenotype when expressed in plants, the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô

The present invention relates to the isolation of corn ear-derived polymuclectides (cdps) from the corn (Zea mays) cDNA libraries SATMONO22 and SATMONO23. Some of the cpds uniquely identify structural, functional, and standardry genes of corn ear. The polymuclectides sequences are useful for detecting cpds in a sample, for producing a corn ear specific profile of gene transcription, for detecting altered gene expression in inbred or hybrid plants, and for screening several molecules for specific binding to the polymuclectide. The cdps are useful to identify, isolate, or extend identical or related corn-ear nucleic acid sequences from DNA libraries, and in nucleic acid amplification or hybridisation techniques of the sylvasion of desirable traits through plant breeding programs. Perferably, the cdps are used to identify, evaluate, alter, or follow the inheritance of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality, and yield of corn. The cdps are also useful in field properides by recombinant techniques. They are also useful in disgnostic assays to recombinant techniques. They are also useful in disgnostic assays to recombinant techniques. They are also useful in disgnostic assays to detect or confirm conditions or diseases associated with abnormal levels of cdp expression. Abx81641-Abx89140 represent corn ear-derived polymuclectides (cpds) of the invention. Note: The sequence data for this pectual disease associated with abnormal levels of petent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site at

The protein and DNA sequences have been isolated from Zea mays (corn), and the invention also includes oligonucleotides AAC83114 - AAC83139 which are related to
